## **Summary:**

Capital Custom Clothiers is a family-owned custom tailor shop based in Annapolis, Maryland. Since 2010 they have been steadily carving out a niche within the Annapolitan bespoke market. As a family business of 3 members, responsibilities are starkly defined. However, there is a clear gap in the ability to analyze sales concisely through one modality. Currently, Capital uses QuickBooks to keep account of payments made and received but this is primarily used as a compliance mechanism for tax purposes. The database we would like to implement would not only provide specific data about the most popular products, but also give insight as to which business segments are the most lucrative as well. We expect that with the increased ability to discern customer proclivities, we will be able to narrow business focus to the highest yielding outputs. Once the conceptual and logical models are approved by our stakeholders, we will proceed to the physical database creation.

## **Stakeholders:**

The primary stakeholders for this project are the two business owners and their daughter who also double as the employees of the business. The secondary stakeholders are potentially the consumers of the product, the customers. A successful deployment of this database will potentially increase revenue for the business owners and provide customers a wider selection of the items they purchase most. Owners will now be able to assess which area of the business is most lucrative, what types of alterations are typically requested and what article of custom attire is most sought after. Customers will be able to see cost estimates, which products they've previously purchased, and the status of their payments. Additionally, new insights could provide the impetus to streamline customer access to high demand products and services.

## **Business Rules:**

- ☐ You must pay 50% upfront for custom attire to secure fabric
- ☐ Other 50% must be paid at final fitting to leave with attire
- ☐ For rentals you must submit rental agreement
- ☐ For rentals you must submit your measurements before order can be placed
- ☐ Rental order must be paid in full before order is placed
- ☐ A custom suit takes 4-6 weeks to be made
- ☐ A custom order placed with an initial deposit cannot be cancelled after 24 hours
- ☐ For non-custom orders, items may be returned within 5 business days with a 20% restock fee

## **Glossary:**

**Client** – An individual who schedules an appointment online, via phone, or in person

**Alteration** – A garment being altered to customer specifications

**Order** – A measurement form with stylistic details sent to workshop

**Bespoke/Custom Attire** – A commissioned piece of clothing with 20 or more measurements

**Invoice** – Itemized summation of services rendered with total cost

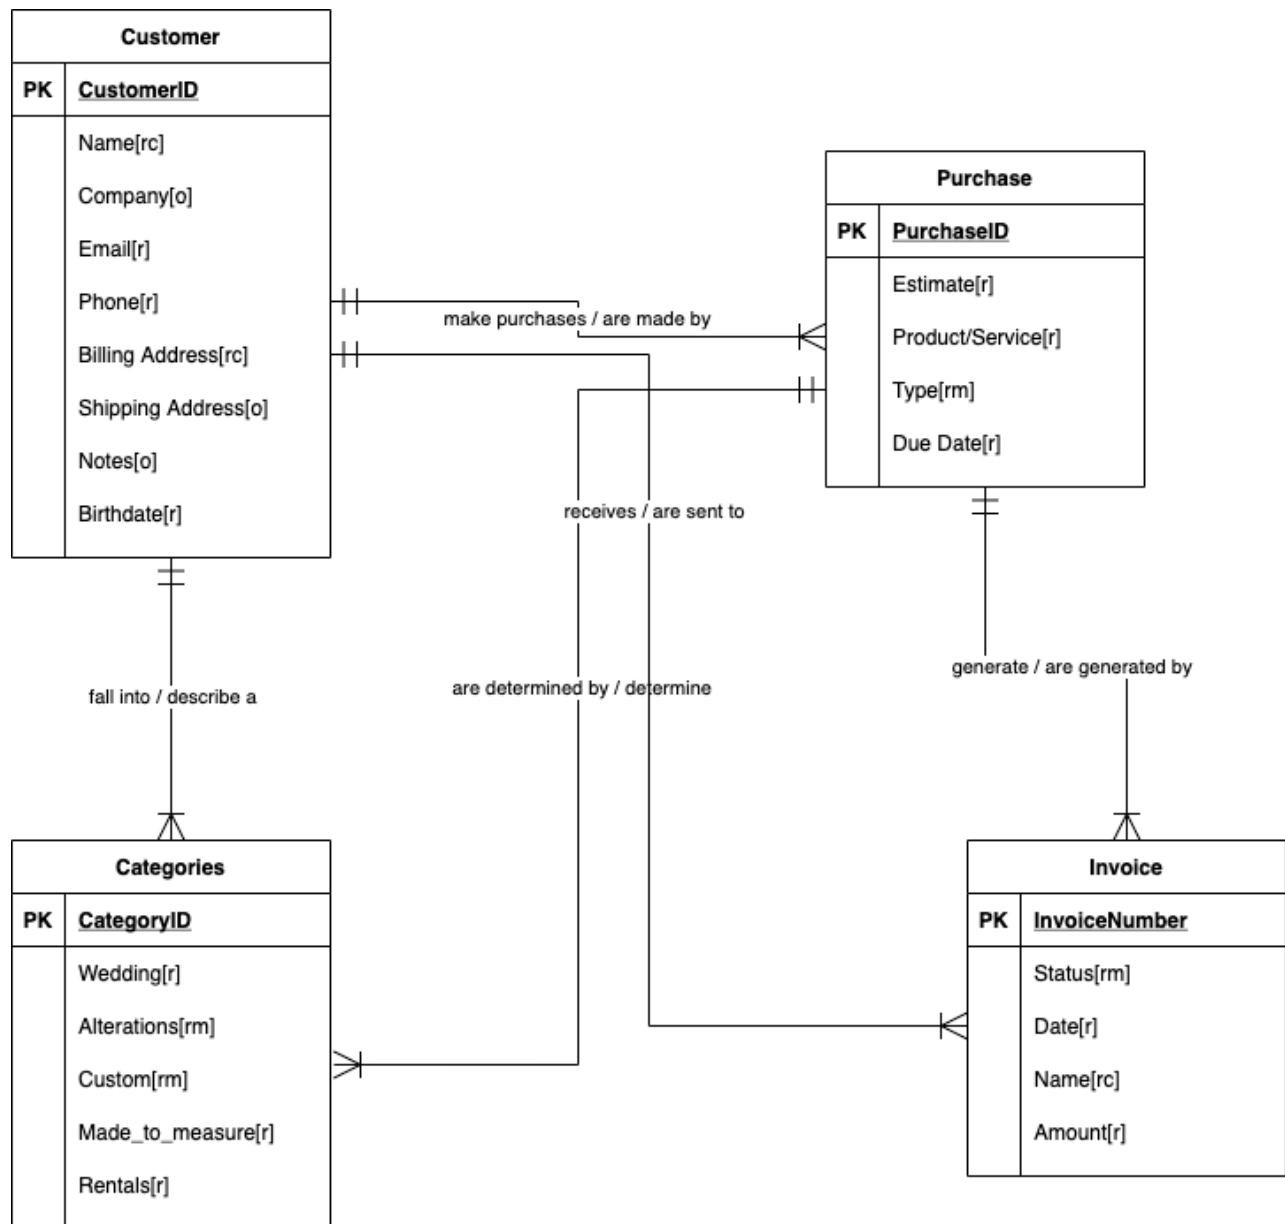

**Invoice Status** – Can be overdue, paid, closed

**Managed Wedding Party** – Ensuring all members of a wedding party meet deadlines to receive wedding attire on time.

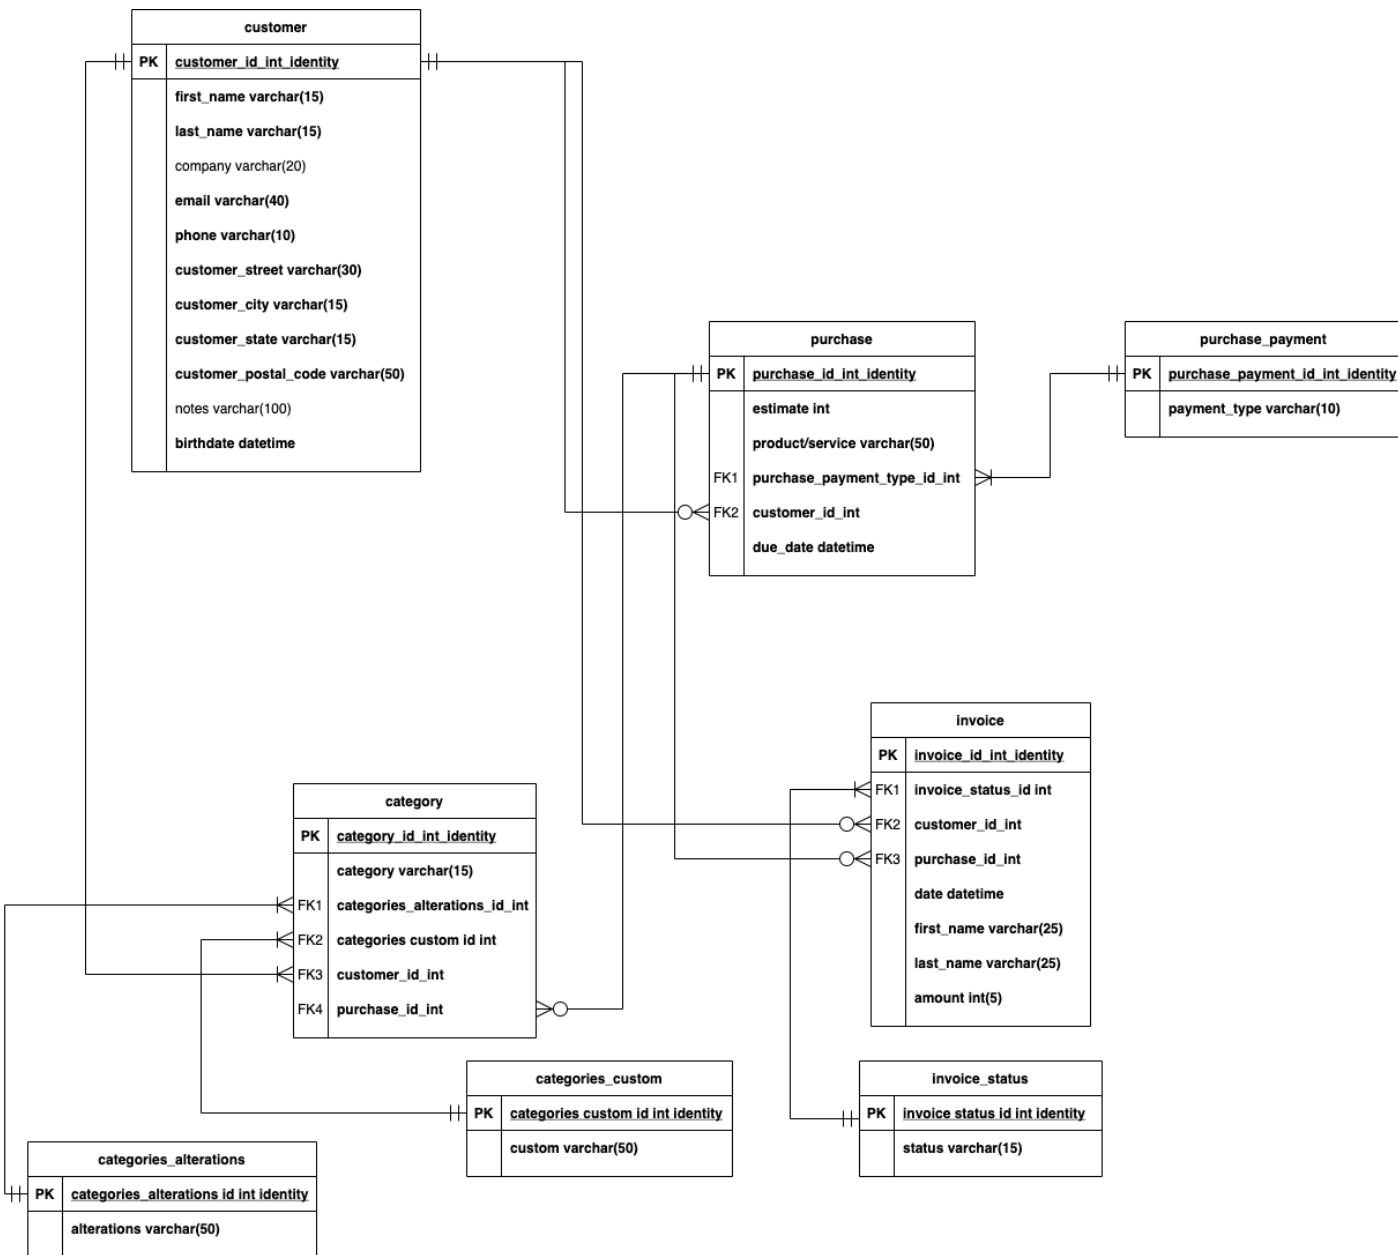

## **Data Questions:**

- ◆ What is the most purchased piece of custom attire?
- ◆ How many weddings are done annually?
- ◆ What types of alterations are done the most?
- ◆ How many made to measure shirts are done annually?

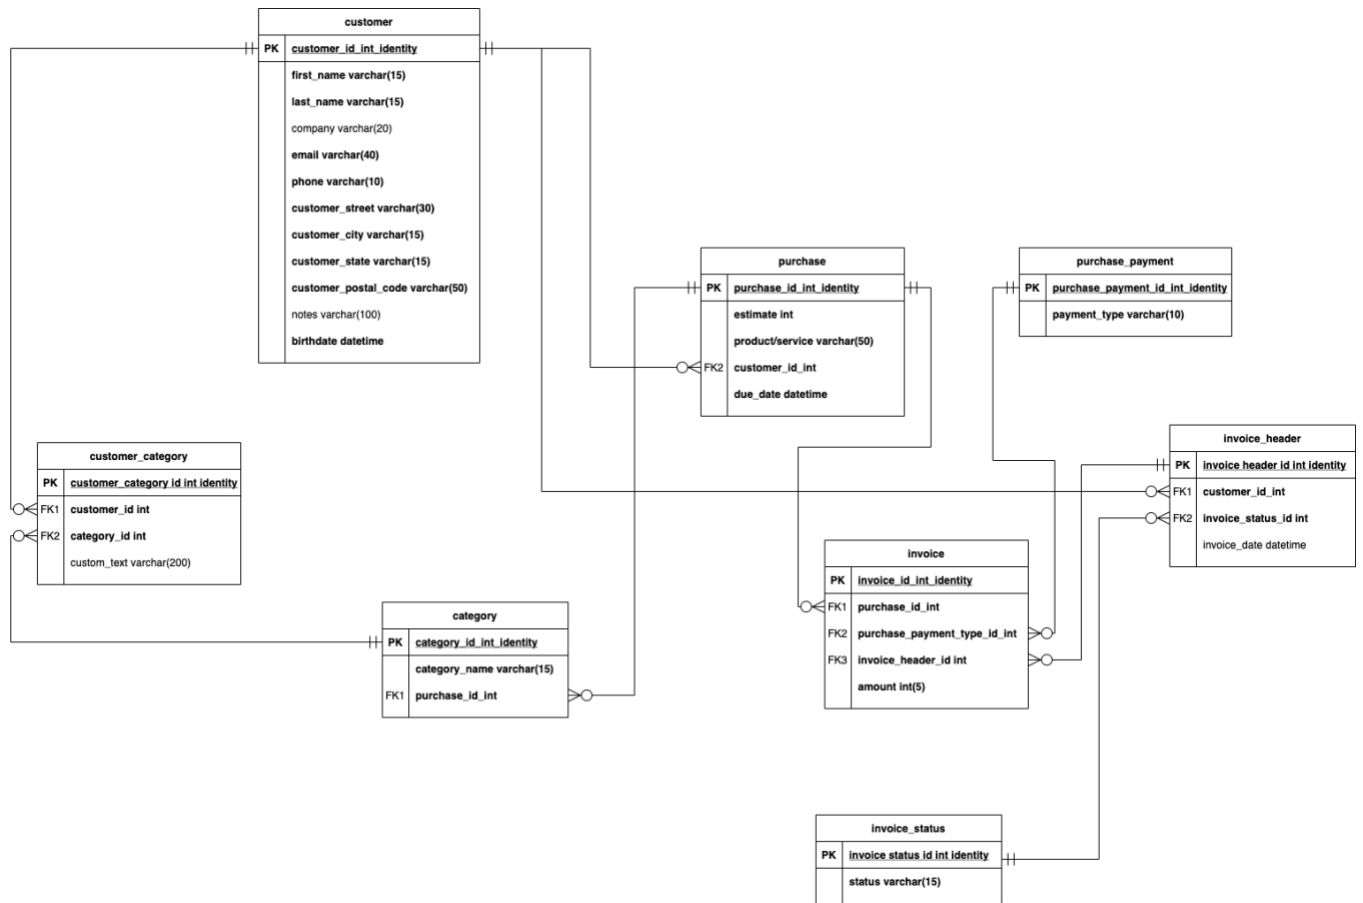

## **ERD - Conceptual Model:**

## Logical Model, Deliverable 1:

## Logical Model, Deliverable 2:

## Logical Model Amendments, D2:

- ◆ “Custom\_text varchar(200)” was removed from the customer\_category table. This field was redundant as there is a “notes” section in the customer table.
- ◆ “estimate int” and “due\_date datetime” were removed from the table purchase. Both fields became redundant upon further investigation into the invoice related tables.
- ◆ The **GETDATE()** function was appended to two tables for good housekeeping measures.

## **SQL SERVER CODE:**

/\*Drop Section:

Here, as a precautionary measure we preemptively drop the tables we intend to create should they exist in the database already.\*/

```
IF EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE
TABLE_NAME = 'invoice')
BEGIN
    DROP TABLE invoice
END
GO
```

```
IF EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE
TABLE_NAME = 'invoice_header')
BEGIN
    DROP TABLE invoice_header
END
GO
```

```
IF EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE
TABLE_NAME = 'customer_category')
BEGIN
    DROP TABLE customer_category
END
GO
```

```
IF EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE
TABLE_NAME = 'category')
BEGIN
    DROP TABLE category
END
GO
```

```
IF EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE

**Graphical User Interface:**

The image shows the input section of the customer intake form, set against the same river stone background. At the top, the text "Capital Custom Clothiers" is repeated in the same white cursive script as in the header. Below this, there are five input fields, each with a label in a small, white, sans-serif font and a corresponding white rectangular box for text entry. The fields are arranged in two rows: the first row contains "First Name" and "Last Name"; the second row contains "Email Address" and "Date of Birth". A single "Phone Number" label is centered above a box that spans the width of the two columns in the second row.

# Capital Custom Clothiers

Company	Postal Code
<input type="text"/>	<input type="text"/>
Street Address	Product or Service
<input type="text"/>	<input type="text"/>
City	Product Category
<input type="text"/>	<input type="text"/>
State	Gender
<input type="text"/>	<input type="text"/>

**Reflection/Discussion:**

While enriching, the creation of this database was quite an arduous task for me that required a tremendous amount of humility and patience. I ran into the same error message multiple times in different forms and ultimately it got the best of me:

Msg 515, Level 16, State 2, Line 192

Cannot insert the value NULL into column 'purchase\_id', table

'IST659\_M407\_makonnor.dbo.category'; column does not allow nulls. INSERT fails.

The statement has been terminated.

Despite my best efforts, I was not able to derive a solution, so I created a work-around instead. I had to flatten the database a bit which in a higher-stakes situation would be disadvantageous to the business in that it negates some of the hard work we did to normalize our database in the first place.

The beauty of database creation is there is never a true “end” point. The database can always be further optimized. For instance, I was initially conservative with my varchar lengths because I wanted to optimize as much as possible. However, I underestimated the lengths of certain datapoints which caused me to have to drop the tables and start over. I added ample room next time but certainly too much.

If I were to begin again, I would spend a lot of time trying to better comprehend the three normal forms. They are crucial in terms of visualizing the layers and nuances of how the database will interact with itself. Even then at times, for a beginner, it is difficult to conceptualize what is happening behind the scenes. To that point, I would rearrange my

conceptual model as well to fit more of a “spoke-and-wheel” shape. I believe that aesthetic would have aided in visualizing a little easier.

Heeding the advice of starting early is crucial. Hindsight is 20/20 and just because the labs are straightforward it doesn't mean success will be as abundant when the training-wheels come off. Time is also a crucial factor in terms of communication with your stakeholder. Things change, which means the database has to as well. Anticipating as many potential issues in advance will pay large dividends. A unique balance of rigidity and flexibility in my limited opinion are needed for a solid database. Views are helpful with this. I would also in the future like to add stored procedures that allow for a safer, more controlled input of data. For now, there are only 3 intended users who are also family members, so information security isn't a huge issue currently. However, should another employee be hired, that may need to be addressed. A stored procedure would also need to be created for deleting information as well.

The extent of a database's usefulness can only be measured by the creativity of the engineer and the vision of the stakeholder(s). Though the scale of this project may have been smaller in scope, a customized database specified for the needs of a stakeholder is immensely useful. With a few queries and the use of aggregate functions, the entire business focus of an organization can be heavily influenced and provide direction where there was once only speculation.
